

Common Q&A

Q: I shot someone in very short distance, I do not think I have missed, but it appeared so. Is there any problem with my gun?

A: The laser spot is much smaller in short distance. So if you are too close to your target, it actually will be much harder to get it.

Keep in distance, aim carefully, you will have more chance.

Q: I did get somebody, I even have felt the vibration behind my right shoulder, but my kill record is zero, why?

A: Maybe you got a wrong guy, like your teammate. You lose one point whenever this happens.

Q: Can I shoot through the glass like windshield?

A: Yes you can, but the glass can cause some funny effect of your "laserbullet", like refraction, which can change your aim unexpectedly.
